

**VWS Internal Body Camera for Load Appraisal and Monitoring**

The VWS Internal Body Camera (WIFI) is available. The purpose of the camera is to allow a visual confirmation or a view of the inside of the body of your trailer.

Typical uses would include:

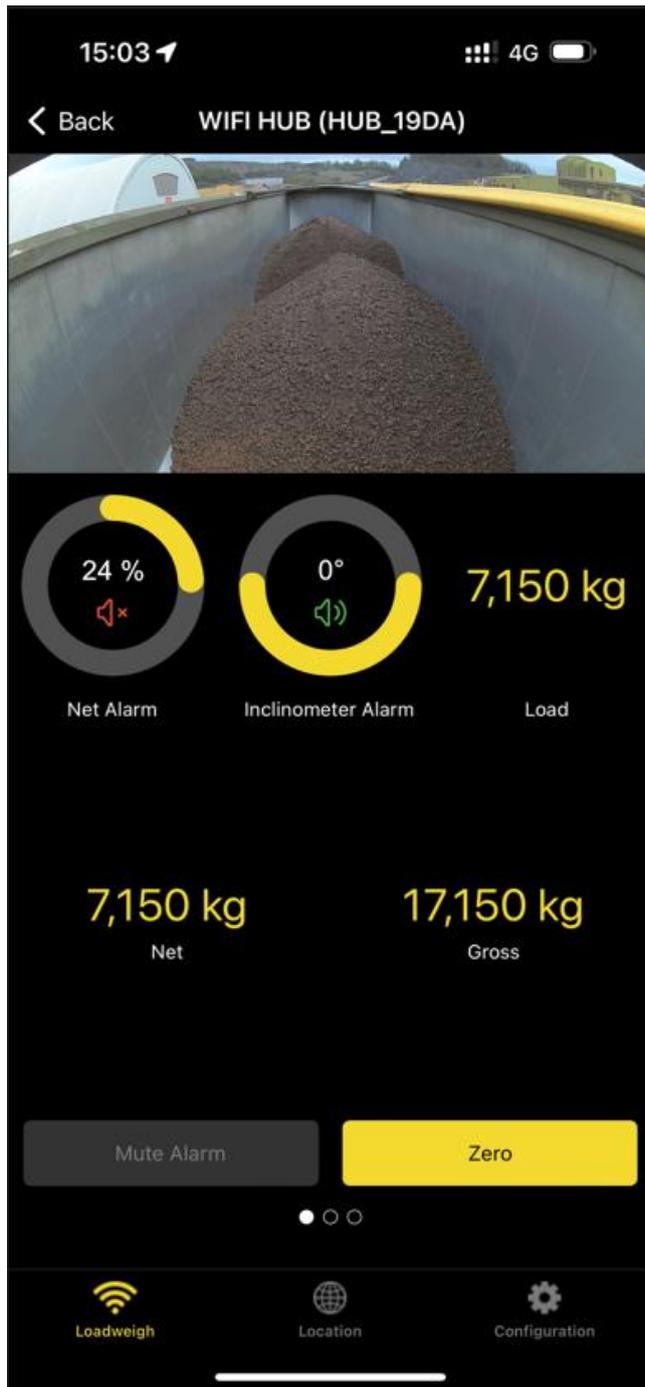

Record of Unloaded Body

Record of Loaded Body

Monitoring of the load type

Monitoring of the load position in the body

Many types of loading and unloading operations now restrict the driver/operator from climbing up the catwalk or entering the body of the trailer. The camera offers the driver/operator the opportunity to view the internal status of the trailer.

The camera requires:

An external power feed.

A VWS Indicator mounted onto the trailer within WIFI range of the camera.

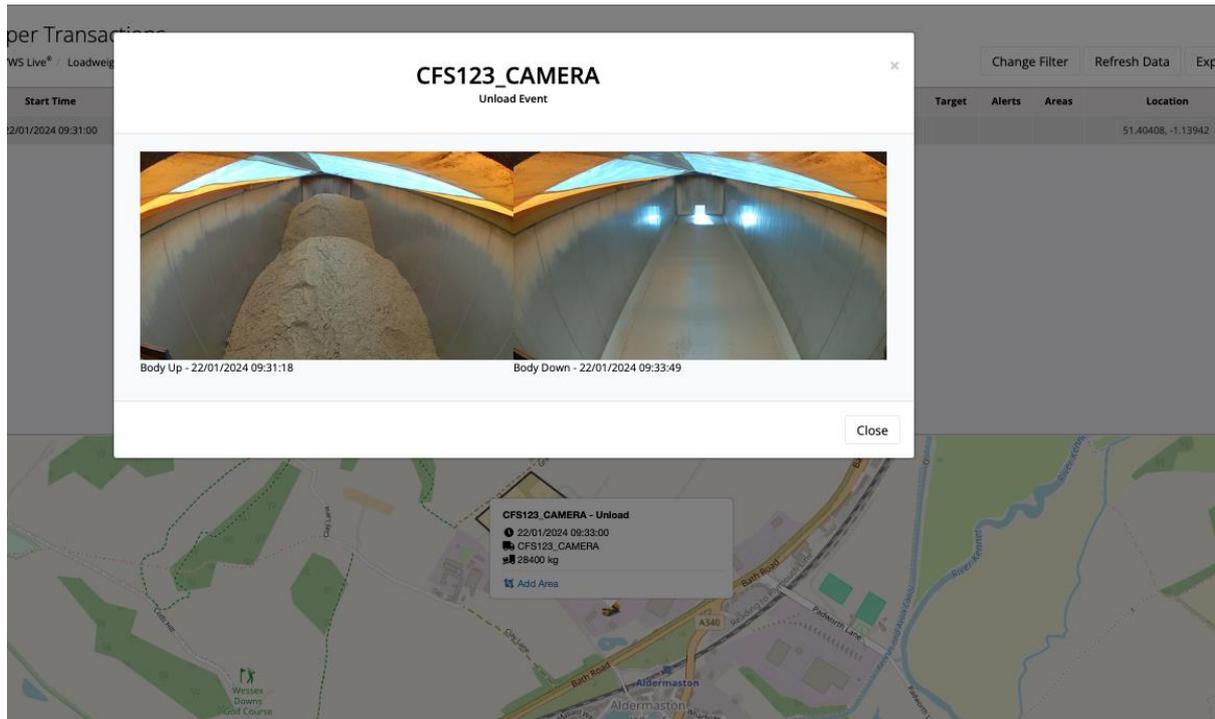

A VWS WIFI hub (In addition to the VWS indicator).

A VWS connected wifi device – such as a mobile phone; tablet or other item.

The camera is operated from the VWS app on your device. The operator can view the internal pictures.

Additionally the system can be configured to record and send the single picture of the loaded state and unloaded state together with other metrics of the load status – such as tare weight and positioning in the body.

AIC KIWA TASCSC assistance. Operators running under regulation of AIC KIWA TASCSC food standards and hygiene may potentially use the internal date; time; location; picture useful as a recording for audit proofs.
